

ABOUT THIS REPORT

This report was produced using live on the market rental and sales listing data. We have maximised accuracy by only publishing those suburb results with high enough data sample sizes. This data is also calculated at both a dwelling type and bedroom number level. This increases its relevance for investors, but it also means it will vary from commonly published house and unit median yields that include all bedrooms as consolidated median yield results. This report is designed to identify the fastest moving suburbs based on the average days a listing spends on the market at a suburb and property type level. Low average days on market indicates that the market is turning over stock quickly which may indicate that demand is stronger than supply. You should always conduct additional due diligence on any property and the suburb it is located in to ensure it meets your investment criteria.

ABOUT THIS REPORT

This report was produced using live on the market rental and sales listing data. We have maximised accuracy by only publishing those suburb results with high enough data sample sizes. This data is also calculated at both a dwelling type and bedroom number level. This increases it's relevance for investors, but it also means it will vary from commonly published house and unit median yields that include all bedrooms as consolidated median yield results. This report is designed to identify the fastest moving suburbs based on the average days a listing spends on the market at a suburb and property type level. Low average days on market indicates that the market is turning over stock quickly which may indicate that demand is stronger than supply. You should always conduct additional due diligence on any property and the suburb it is located in to ensure it meets your investment criteria.

ABOUT THIS REPORT

This report was produced using live on the market rental and sales listing data. We have maximised accuracy by only publishing those suburb results with high enough data sample sizes. This data is also calculated at both a dwelling type and bedroom number level. This increases it's relevance for investors, but it also means it will vary from commonly published house and unit median yields that include all bedrooms as consolidated median yield results. This report is designed to identify the fastest moving suburbs based on the average days a listing spends on the market at a suburb and property type level. Low average days on market indicates that the market is turning over stock quickly which may indicate that demand is stronger than supply. You should always conduct additional due diligence on any property and the suburb it is located in to ensure it meets your investment criteria.

ABOUT THIS REPORT

This report was produced using live on the market rental and sales listing data. We have maximised accuracy by only publishing those suburb results with high enough data sample sizes. This data is also calculated at both a dwelling type and bedroom number level. This increases it's relevance for investors, but it also means it will vary from commonly published house and unit median yields that include all bedrooms as consolidated median yield results. This report is designed to identify the fastest moving suburbs based on the average days a listing spends on the market at a suburb and property type level. Low average days on market indicates that the market is turning over stock quickly which may indicate that demand is stronger than supply. You should always conduct additional due diligence on any property and the suburb it is located in to ensure it meets your investment criteria.
